WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

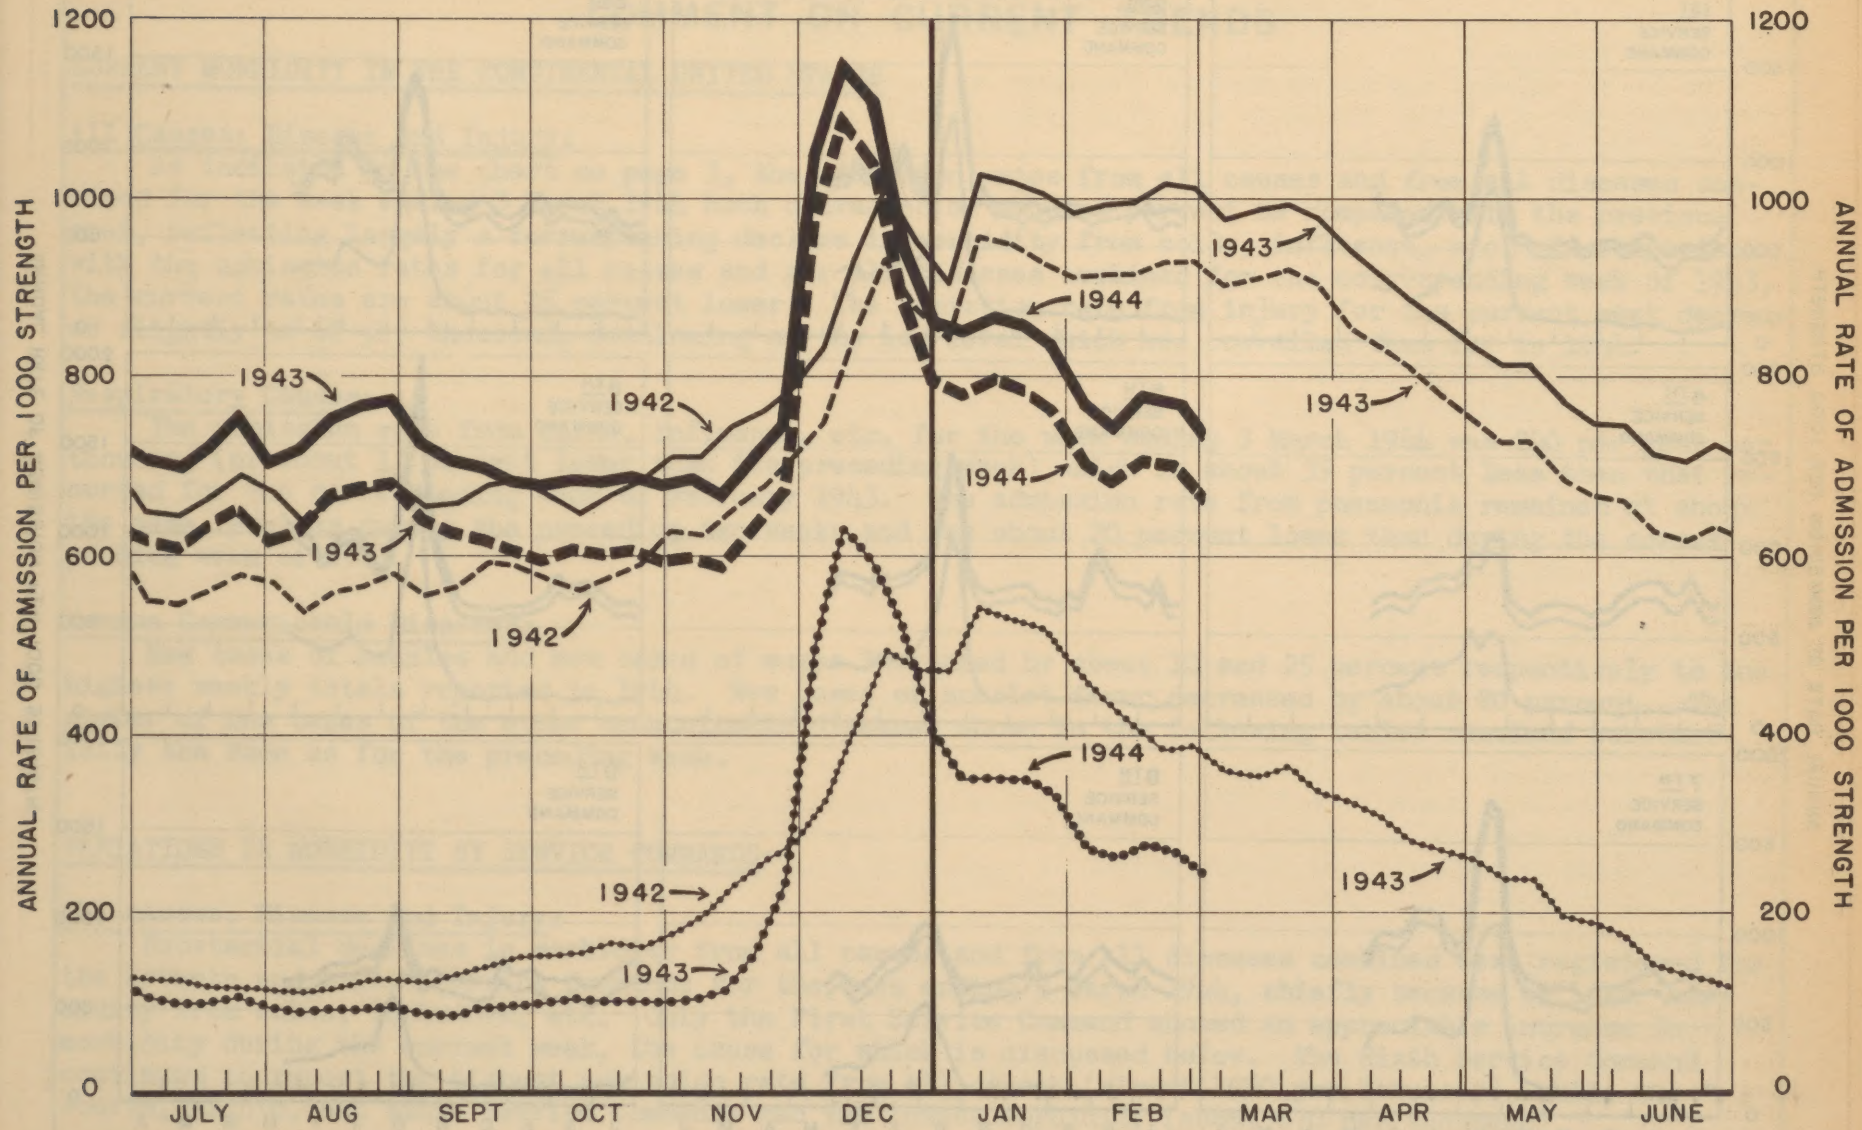

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 3 MARCH 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined for the week ending 3 March 1944 both decreased by about 5 percent as compared with the previous week, reflecting largely a corresponding decline in morbidity from colds, influenza, etc. In comparison with the admission rates for all causes and for all diseases combined for the corresponding week of 1943, the current rates are about 25 percent lower. The admission rate from injury for the current week decreased slightly to 67 per thousand, continuing on the low level which has prevailed thus far in 1944.

Respiratory Causes:

The admission rate from colds, influenza, etc. for the week ending 3 March 1944 was 240 per year per thousand (or about 12 percent lower than the preceding week) which is about 35 percent less than that recorded for the corresponding week of February 1943. The admission rate from pneumonia remained at about the same level as during the preceding two weeks and was about 20 percent lower than during the corresponding week of 1943.

Common Communicable Diseases:

New cases of measles and new cases of mumps increased by about 10 and 25 percent respectively to the highest weekly totals reported in 1944. New cases of scarlet fever decreased by about 20 percent. The number of new cases of the other communicable diseases shown in the following tables remained substantially the same as for the preceding week.

VARIATIONS IN MORBIDITY BY SERVICE COMMANDS:

All causes: Disease and Injury:

Substantial declines in morbidity from all causes and from all diseases combined were registered for the Seventh and Eighth Service Commands for the week ending 3 March 1944, chiefly because of lower morbidity from colds, influenza, etc. Only the First Service Command showed an appreciable increase in morbidity during the current week, the cause for which is discussed below. The Sixth Service Command continued to report the highest admission rate from all causes (almost 1060 per thousand), while the Fourth, Eighth, and Ninth Service Commands had the lowest morbidity (about 670 per thousand).

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 3 MARCH 1944

COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

The First, Sixth, and Ninth Service Commands reported slightly higher morbidity from colds, influenza, etc. whereas all the other commands reported lower admission rates. The Seventh Service Command continued to report the highest admission rates from colds, influenza, etc. (455 per thousand), while the lowest morbidity from these causes (168 per thousand) was again reported by the Eighth Service Command.

Common Communicable Diseases:

The Second Service Command which had experienced the highest morbidity from venereal disease (excluding EPTI cases) the preceding week, again reported a marked decline in admission from these causes. The increased numbers of new cases of measles reported by the First and Ninth Service Commands account for practically the entire increase in the total number of new measles cases in the country; the Fourth and Eighth Service Commands continued to show the largest numbers of new cases of measles (slightly more than half of the total). Almost every Service Command showed an increase in the number of new cases of mumps, but the Fourth Service Command continued to account for about one-third of the total new cases in the country. The increase in the admission rate from all causes and all diseases combined in the First Service Command, mentioned above, arose in large part from an outbreak of bacterial food poisoning at Bradley Field, Conn. (239 cases).

CURRENT HOSPITAL CONDITIONS

The total bed capacity as of 3 March 1944 was reported at 384,000 or 2,000 more than at the end of the previous week. The number of beds occupied was about 168,000 or 4,500 less than at the end of the previous week, while the number of "available vacant" beds increased to 139,000. There were 17 stations with bed capacity of about 5,000 having no "available vacant" beds; included were no General Hospitals.

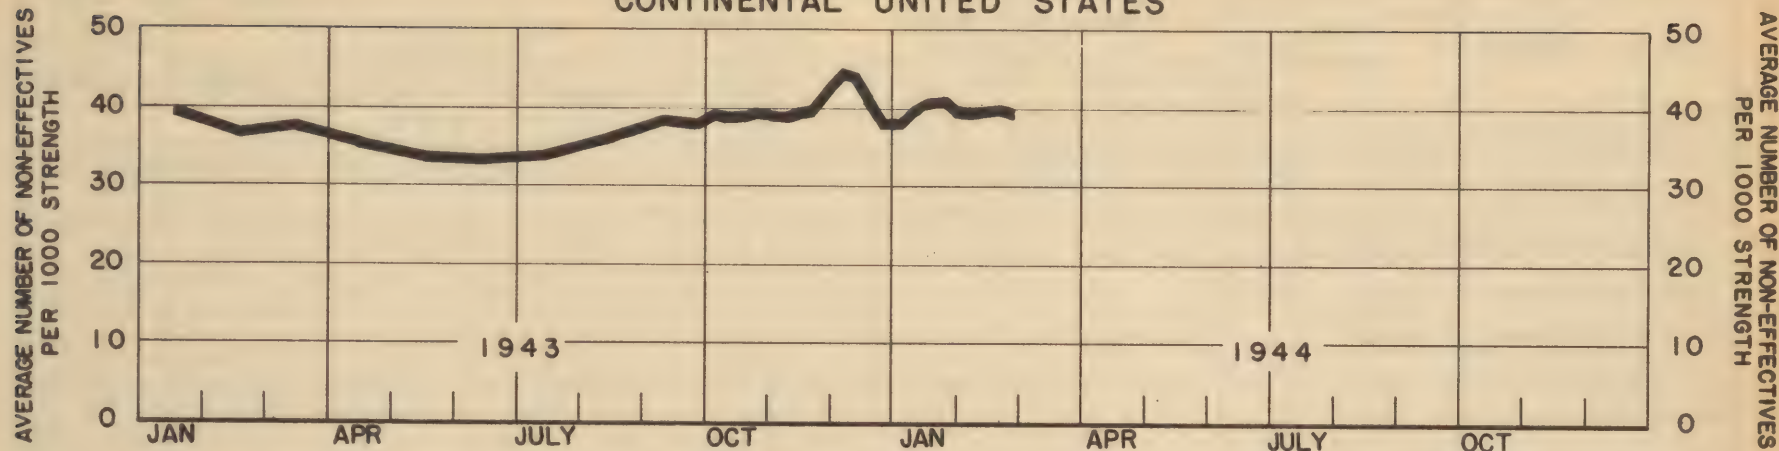

On 3 March 1944 there were 2,198 cases of malaria remaining under treatment, all but 11 of which had presumably been acquired outside the United States. The number of neuropsychiatric cases remaining at the end of the week was reported at 16,491 while the number of tuberculosis cases remaining totaled 1,144.

NON-EFFECTIVE RATE

During this year the non-effective rate has fluctuated within a narrow range around 40 per thousand strength, or somewhat above the level prevailing during the early part of 1943 (about 36 per thousand). This increase is due in large part to the increasing numbers of evacuees from overseas. For instance the non-effective rate for the week ending 3 March 1944 is reduced from 39.4 per thousand to 38.5 per thousand if days lost by battle casualties in General Hospitals are excluded. The reduction would obviously be even greater if days lost by Army patients evacuated because of disease and non-battle injury were excluded.

WEEK ENDING 25 February 19 44
VOLUME IV REPORT NO. 9

[illegible]

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 FEBRUARY 1944

PRISONERS OF WAR

During the four week period ending 25 February 1944, morbidity from all causes among prisoners of war was at the very low level of about 500 admissions per year per thousand strength, or only about 65 percent of that for U.S. troops in the continental United States during the same period. Correspondingly, morbidity from all diseases combined during January, at 415 per thousand strength, was only about 60 percent of that for U.S. troops in this country. As compared with January the admission rates for all causes and all diseases combined among prisoners of war were about 20 percent lower, reflecting chiefly decreased morbidity from colds, influenza, etc. The February admission rate for injury continued at about the same level as in the previous two months and was about 10 percent higher than for U.S. troops in the continental United States.

The morbidity rate among German prisoners was higher than among Italian prisoners from both disease and injury. As in previous months the injury admission rate for Italian prisoners continued at a very low level (about 30 per thousand), whereas the rate for German prisoners was more than 3 times as high as for Italians and in fact was about 35 percent higher than for U.S. troops in the continental United States.

Several spot studies made in connection with the high injury admission rates among German prisoners of war point to the general conclusion that this experience is the result of two distinct factors; first, the nature of the work in which the prisoners are engaged and second, their vigorous participation in athletic activities (notably soccer-football). In reference to the former, work in lumbering and forestry has resulted in a relatively large number of minor injuries, although the injury rate should not be considered as very high for the type of work involved.

Morbidity from colds, influenza, etc. among prisoners of war decreased from the rates of 238 and 182 per thousand in December and January respectively to the very low figure of 93 per thousand for February. This rate compares favorably with the lowest seasonal rates experienced by U.S. troops in summer months and is substantially below the present experience of our troops in this country (namely, about 275 per thousand). The markedly lower rates of admission from respiratory causes among prisoners of war account in large part for the much lower morbidity from disease of prisoners of war as compared with U.S. troops in the continental United States. An important reason for the lower morbidity from respiratory causes among prisoners is that their camps are predominately located in the Southern states which have not experienced as high morbidity from colds and influenza as the remainder of the country. Morbidity from colds, influenza, etc. was at a somewhat higher rate for Italian prisoners than for Germans, the admission rates being 105 and 89 per thousand respectively.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 25 FEBRUARY 1944

PRISONERS OF WAR (CONT'D)

In February there was only one case of diphtheria reported among prisoners of war; this continues the favorable experience of January and contrasts with the record for the last quarter of 1943 when sizeable numbers of cases were reported each month. Likewise the number of new cases of jaundice continued at a relatively low level. On the other hand the annual admission rate from malaria among prisoners of war (representing in February cases acquired outside of the United States only) increased for the second consecutive month to 52 per thousand, the highest thus far recorded. Morbidity from malaria was at a slightly higher rate among Italian prisoners than among the Germans, the admission rates being 55 and 50 respectively. The admission rate for diarrhea and dysentery continued at the seasonally low level of about 5 per thousand strength. All the other causes of admission considered in the following tables showed relatively small numbers of cases.

The camps reporting the highest morbidity from all causes and from disease were: Camp Pickett, Va. (German), Camp Sidnaw, Mich. (German), McClean, Texas (German), Ft. Lewis, Wash. (German) and Ft. D.A. Russell, Texas (German), all of which had rates of more than 2000 per thousand. Certain camps continue to have high admission rates from injury: namely, Clinton, Miss. (German), Camp Gruber, Okla. (German) and McClean, Texas (German) all of which had rates of more than 300 per thousand in both January and February.

The number of prisoners of war remaining under treatment in hospital at prisoner of war camps as of 25 February 1944 and the corresponding rate per thousand strength are shown below. In contrast with the situation as of 28 January 1944 when there were about 3000 prisoner patients remaining in hospital in prisoner of war camps, the number remaining on 25 February was about 3300, or a 10 percent increase. In addition to the prisoners of war remaining under treatment in hospital in the prisoner of war camps, there were 536 prisoners remaining under treatment in other hospitals; of this number 459 were in General Hospitals.

	Number Remaining	Prisoner Patients Remaining per 1000 strength
German	2305	19
Italian	978	20
